

Exercise Set 6

More Python

University of Oslo - IN3110/IN4110

Fall 2019

Note: These exercises are not mandatory. You don't have to put your work into your Github repository.

Create a script that takes in a string from the command line, and prints the string out. By using the `argparse` module, allow the user to capitalize and/or reverse the string (implement more things if you like).

Finally, create a setup script for your script by using the `setuptools` module and install your script system-wide.
